

NID OCR API — Integration Guide

Version: 3.0

This API extracts printed data fields from images of Bangladesh National ID (NID) cards. Send an image of the front or back of a card and receive the extracted fields back as JSON.

Demo Environment

Base URL: `http://35.238.26.55:8000`

This environment is provided for integration testing. It is not guaranteed to retain uptime SLAs; a production endpoint with authentication and SLAs can be provisioned separately once integration is confirmed.

- Interactive API explorer: `http://35.238.26.55:8000/docs`

Authentication

No authentication is required in this demo environment. Production access will be issued with an API key or token — this section will be updated once that is provisioned. Until then, please treat the demo URL as confidential and do not share it outside your integration team.

Endpoints

POST `/nid/front`

Extracts fields from the **front side** of an NID card.

Request — `multipart/form-data`

Field	Type	Required	Description
<code>file</code>	file	yes	Image of the front of the NID card

Supported file types: `.png`, `.jpg`, `.jpeg`, `.bmp`, `.tiff`, `.webp`

Response — `200 OK`, `application/json`

```
{
  "name": "MD SAKIB HASAN",
```

```
"father_name": "MD ABDUL KARIM",
"mother_name": "MST RAHIMA BEGUM",
"spouse_name": null,
"date_of_birth": "01 Jan 1995",
"nid_number": "1234567890123"
}
```

Field	Type	Notes
name	string null	Cardholder's name
father_name	string null	
mother_name	string null	
spouse_name	string null	Present only on some card layouts
date_of_birth	string null	As printed on the card
nid_number	string null	

Fields not found on the card are returned as `null` — this is expected behavior for cards that omit a field (e.g. no spouse name), not necessarily an error.

Example

```
curl -X POST "http://35.238.26.55:8000/nid/front" \
-F "file=@front.jpg"
```

POST /nid/back

Extracts fields from the **back side** of an NID card.

Request — `multipart/form-data`

Field	Type	Required	Description
file	file	yes	Image of the back of the NID card

Supported file types: same as `/nid/front`.

Response — 200 OK, application/json

```
{
  "address": "House/Holding: 535 ..., Village/Road: ..., Post Office: ..., Dhaka",
  "blood_group": "B+",
  "issue_date": "26/08/2021",
  "place_of_birth": "Dhaka"
}
```

Field	Type	Notes
address	string null	
blood_group	string null	
issue_date	string null	
place_of_birth	string null	Present only on newer ("Smart") card layouts

Example

```
curl -X POST "http://35.238.26.55:8000/nid/back" \
-F "file=@back.jpg"
```

Error Responses

Errors are returned as JSON: {"detail": "<message>"}.</p>
</div>
<div data-bbox="91 647 575 785" data-label="Table">
<table>
<tr>
<th>Status</th>
<th>Meaning</th>
<th>Typical cause</th>
</tr>
<tr>
<td>400 Bad Request</td>
<td>Invalid request</td>
<td>The uploaded file's type isn't one of the supported image formats.</td>
</tr>
</table>
</div>

422 Unprocessable Entity	Could not process the image	The image was readable but the system could not recognize it as an NID card, or could not extract usable data from it. Usually resolved by re-uploading a clearer photo.
500 Internal Server Error	Unexpected server error	Transient failure — safe to retry. Contact us if it persists.

Integration Notes

- **One request per side.** The front and back of a card are two separate uploads to two separate endpoints — there is no combined endpoint.
- **Image quality matters.** Well-lit, in-focus, uncropped photos taken directly above the card produce the most reliable results. Avoid glare and shadows.
- **Missing fields are not failures.** A `null` value means that particular field wasn't present or legible on the card, not that the request failed — check the HTTP status code to determine success/failure, not whether every field is populated.
- **Idempotent and stateless.** Each request is processed independently; there is no session or multi-step flow.
